

## VERSION 1.2.0

### NEW FEATURES

- This release brings feature parity between MacOS, iPadOS, and Windows platforms
- On launching the App, if a new version of the software is available the Software Update dialog will be shown
- A new context menu for each row in NetSetter enables row-level resets of device parameters

### GENERAL IMPROVEMENTS

- Toggle controls now trigger on release rather than on press to allow for users to slide away and cancel a toggle operation
- Many touch improvements that were made for the iOS release have been ported into the Windows build for Windows touch users
- In Connect Mode, devices can now be dropped onto the array header and will populate the Array starting with the first device
- After initiating a firmware update, there is now the ability to cancel the update after reading the warning dialog
- In Connect Mode, the Connect and Disconnect buttons were moved to the left to improve usability
- “Online” and “Offline” were renamed to reflect the status of the App more correctly to be “Connected” and “Disconnected” to the network
- The Main Menu now has a link to the JBL global support website
- For the Meter views, pressing the view shortcut key again toggles the meter between the Array View and the Circuit View
- Device connection/sync state LEDs have been enhanced to separately indicate a matched (gray), in-sync (green), and lost (yellow) state
- In NetSetter, when a device address or label is deleted and saved, it will now reset to the default
- The firmware update workflow was aligned to follow the multi-select workflow
- The NetSetter multi-select toolbar now has more consistent tool behaviors and workflow

### BUG FIXES:

- Toggle controls now process all commands when clicked extremely quickly
- Fixed an issue where Speaker Preset linking was breaking if orientation was changed first
- Fixed an issue where Speaker Preset linking was breaking if the array quantity was modified
- Fixed an issue where parent EQs were not properly copied to newly created devices when speaker qty was increased
- Fixed an issue when increasing the number of devices in a single-row subwoofer array was not copying orientation properly
- Fixed a bug where the + and - buttons would stop working after the Array quantity was modified using the numeric keypad
- Fixed an issue that would break the EQ graph in the application if the user saved the file while viewing the DSP section of a device in Device Panel
- Fixed an issue where adding units to an Array after opening a file would incorrectly duplicate the Q value of the first EQ filter
- Fixed an issue where minimizing the app while viewing the settings tab of a device in device panel would allow editing of offline sleep parameters upon restore
- Fixed an issue that would reset the Q of a filter to default after copying all EQ filters in a group
- Fixed an issue where the status views would show a failure state after first connecting to a device while waiting the data to be re-freshed.
- Fixed an issue displaying the list of firmware versions correctly for the bottom rows in NetSetter
- Fixed an issue where views shortcut keys stopped working after loading a saved venue file in Mac OS

- Fixed an issue where views shortcut keys stopped working after loading a saved venue file in Mac OS

### **COMPATIBLE FIRMWARE:**

- SRX900 - 1.6.12.42

## **VERSION 1.1.1**

### **BUG FIXES:**

- Added Compatibility for iPadOS 16

### **COMPATIBLE FIRMWARE:**

- SRX 900 - 1.6.8.29

## **VERSION 1.1.0**

Initial Release for iPadOS

### **NOTES ON iPadOS:**

- iPadOS has a different file system with different limitations than Mac or PC and therefore the main menu behaves differently to accommodate the functionality available in iPadOS.
- The recent files list is simply called “Files” and lists all of the files in the application sandbox
- The “Save As” functionality is similar to “Share”
- The “Open” functionality is similar to “Open and Import” where Performance will copy the file into the application sandbox to be able to fully access it. If a file is opened from an external app, it will need to be copied into the Performance sandbox for Performance to fully access it.

### **COMPATIBLE FIRMWARE:**

- SRX 900 - 1.6.8.29

## VERSION 1.0.0

Initial Release for MacOS and Windows

### TARGET FIRMWARE:

- SRX 900 - 1.6.8.29
